The digital root for any given year is found by adding the four individual digits together. The digital root for the year 1201 is 4. If the initial addition results in two digits, then these in turn must also be added together until they furnish a single digit. Thus the digital root for 1066 is also 4.

This puzzle concerns ten dates: those of ten moments in history (varying in their significance) which all share the same digital root. A document, a dynasty, a heroine, an artwork, a vessel, an invention, a novel, a car and a game are clued in alphabetical order of their solutions by wordplay only. The nine (each associated with a date in a different century) are to be inserted into the unnumbered, highlighted spaces wherever they will fit with crossing entries. In nine clues wordplay yields an extra letter not entered in the grid: together these letters describe events in the unclued entry, occurring in a tenth year with the same digital root. This description should be submitted along with your entry. Clues are numbered in alphabetical order of their solutions.
